

EshanPowerflow — Automated Document Routing & Approval System

Tool: Microsoft Power Automate (Cloud Flow)
Domain: Import-Export & Logistics Operations
Integrations: SharePoint · Microsoft Teams · Excel Online · AI Builder
Author: Eshan | MBA (Operations, Supply Chain, International Business)

What This Flow Does

EshanPowerflow is a scheduled automation that replaces 3–5 hours of daily manual document coordination in an import-export operation. It:

1. Detects new shipment documents uploaded to SharePoint
 2. Routes files through a multi-stage approval workflow via Microsoft Teams
 3. Moves approved files to the correct output folder
 4. Logs every decision (approved/rejected, timestamp, approver) to an Excel audit table
 5. Releases the processing queue for the next run
-

Repository Contents

File	Description
EshanPowerflow_CaseStudy.docx	Full case study with annotated screenshots, step walkthrough, business impact metrics
EshanPowerflow_20260604181708.zip	Power Automate flow export — importable into any M365 tenant
assets/flow_trigger_conditions.png	Screenshot: Trigger, file detection, condition gate
assets/flow_file_processing.png	Screenshot: File copy/move, Select/Join, approval launch
assets/flow_approval_routing.png	Screenshot: Post-approval branching, Teams notification, Excel logging
assets/walkthrough.gif	GIF recording of live flow execution

How to Import and Run This Flow

1. Download `EshanPowerflow_20260604181708.zip`
2. Go to Power Automate → **My Flows** → **Import**
3. Upload the `.zip` file
4. Map the connections: SharePoint, Microsoft Teams, Excel Online
5. Enable the flow

Requires: Microsoft 365 license with Power Automate standard connectors

Key Technical Concepts Demonstrated

- Scheduled recurrence triggers with early-exit condition logic
 - SharePoint list-based queue locking (prevents concurrent run conflicts)
 - Multi-approver Teams approval with dynamic timeout handling
 - Select + Join transformations for file manifest generation
 - Nested For Each loops with Excel row-append operations
 - State management across async approval pauses
-

Business Problem Solved

Import-export teams receive high volumes of shipment documents (invoices, bills of lading, customs filings) that require routing, review, and approval across departments. Manual coordination creates compliance risk, version confusion, and shipment delays.

This flow eliminates that entirely — documents are processed, routed, approved, logged, and archived without a single manual step.

Part of Eshan's AI in Supply Chain portfolio. Full details in the case study DOCX.
